. Illamai thadhu kadhak ek ishtami vaasa manila .GPS-guided high-intensity focused ultrasound in rabbit liver with a prototype clinical ultrasound scanner. To evaluate the precision, repeatability, and accuracy of high-intensity focused ultrasound (HIFU) in rabbit liver, using a small clinical ultrasound scanner in combination with an electronic motorized target-tracking device. Precision and repeatability of the HIFU system was analyzed by targeting the edge of the liver of 30 rabbits. Accuracy was determined by comparing the HIFU-generated thermal lesions with histological sections obtained from the affected areas. For a given maximum energy of 75 J, the focal zone size was 125, 250, 500, or 1,000 microm. The 95% confidence intervals for the lower and upper limits of the sizes of the focal zones were always less than half the values, and for the lower limits, the results were always within 10% of the mean value of each group. In combination with the electronic motorized target-tracking device, the described HIFU system was highly precise, repeatable, and accurate. Such HIFU system may, therefore, be suitable for clinical applications. Immunophenotyping of rat tissues using the murine monoclonal antibodies CD2, CD3, CD5, CD7, CD8, CD25, CD38, CD45, CD90, CD96 and H-2K and FACS analysis. We describe the phenotyping of freshly isolated cells and frozen sections of rat tissues. For the phenotyping, the following mouse monoclonal antibodies were used: CD2, CD3, CD5, CD7, CD8, CD25, CD38, CD45, CD90, CD96 and H-2K. The tissue samples were incubated with the antibodies at 4 degrees C or room temperature and then the fluorescence intensity was measured by means of flow cytometry. All investigated tissue samples express the following cell surface molecules: CD3, CD4, CD8, CD11b, CD14, CD21, CD45, CD49d, CD90 and CD96. None of the investigated tissue samples expressed CD2, CD5, CD7, CD13, CD25, CD38, H-2K, CD4, CD29, CD50 and CD102.Q: Insertar dato en una tabla de MySQL
